

CHARLIE CARP

Good dead. Dead good.

CEREAL CROPS

Charlie Carp fertiliser can be used to top dress cereal crops such as wheat, barley, corn & maize.

Charlie Carp fertiliser contains 9% nitrogen, the prime nutrient for promoting yield in cereal crops. Charlie Carp fertiliser also has 2% phosphorous, 6% potassium as well as essential micro nutrients. Results are best when application is made post first node stage.

Nutrients applied as a foliar fertiliser such as Charlie Carp are taken up the plant much quicker than if they were applied with a granular fertiliser. They also do not require a rainfall event to gain maximum effect like granular fertilisers.

Charlie Carp fertiliser applied correctly will aid your plants health and help condition the soil by promoting microbial activity.

By using Charlie Carp fertiliser you are not only improving productivity, you are also helping to clean up the environment by ridding the waterways of European Carp.

APPLICATION RATES

Spray

Mix Charlie Carp 1:10 with water, e.g. 1 litre to 10 litres of water. Apply 100–200 litres of mixture per hectare. Avoid applying during heat of the day. Use large nozzles on boom spray equipment and remove final filters where possible. Agitate concentrate prior to mixing.

Ideally suited as a top dressing fertiliser for application between first node and early boot stages.

Charlie Carp is suitable for aerial application.
